Map-based cloning of a gene controlling omega-3 fatty acid desaturation in Arabidopsis.**Arondel V, Lemieux B, Hwang I, Gibson S, Goodman HM, Somerville C**

MSU-DOE Plant Research Laboratory, Michigan State University, East Lansing, MI 48824-1312.

A gene from the flowering plant *Arabidopsis thaliana* that encodes an omega desaturase was cloned on the basis of the genetic map position of a mutation affecting membrane and storage lipid fatty acid composition. Yeast artificial chromosomes covering the genetic locus were identified and used to probe a complementary DNA library. A complementary DNA clone for the desaturase was identified and introduced into roots of both wild-type and mutant plants by T₄ plasmid-mediated transformation. Transgenic tissues of both mutant and wild-type plants had significantly increased amounts of the fatty acid produced by this desaturase.
